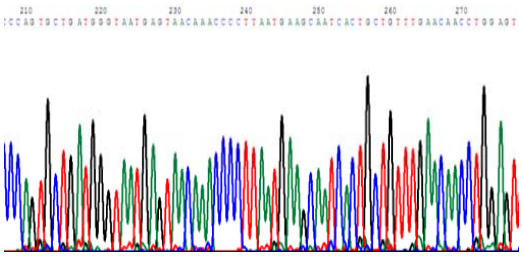
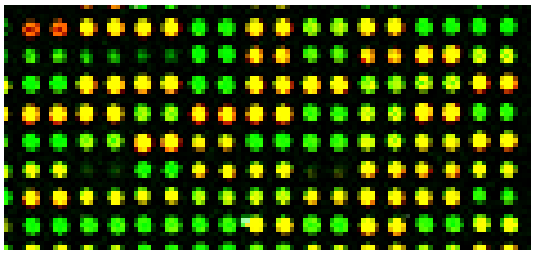
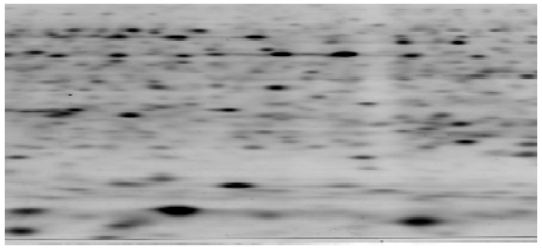
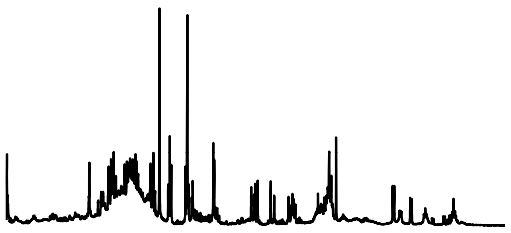
DNA → (Transcription) → mRNA → (Translation) → Proteins ⇄ (Enzyme activity) Metabolites

Genomics	Transcriptomics	Proteomics	Metabolomics

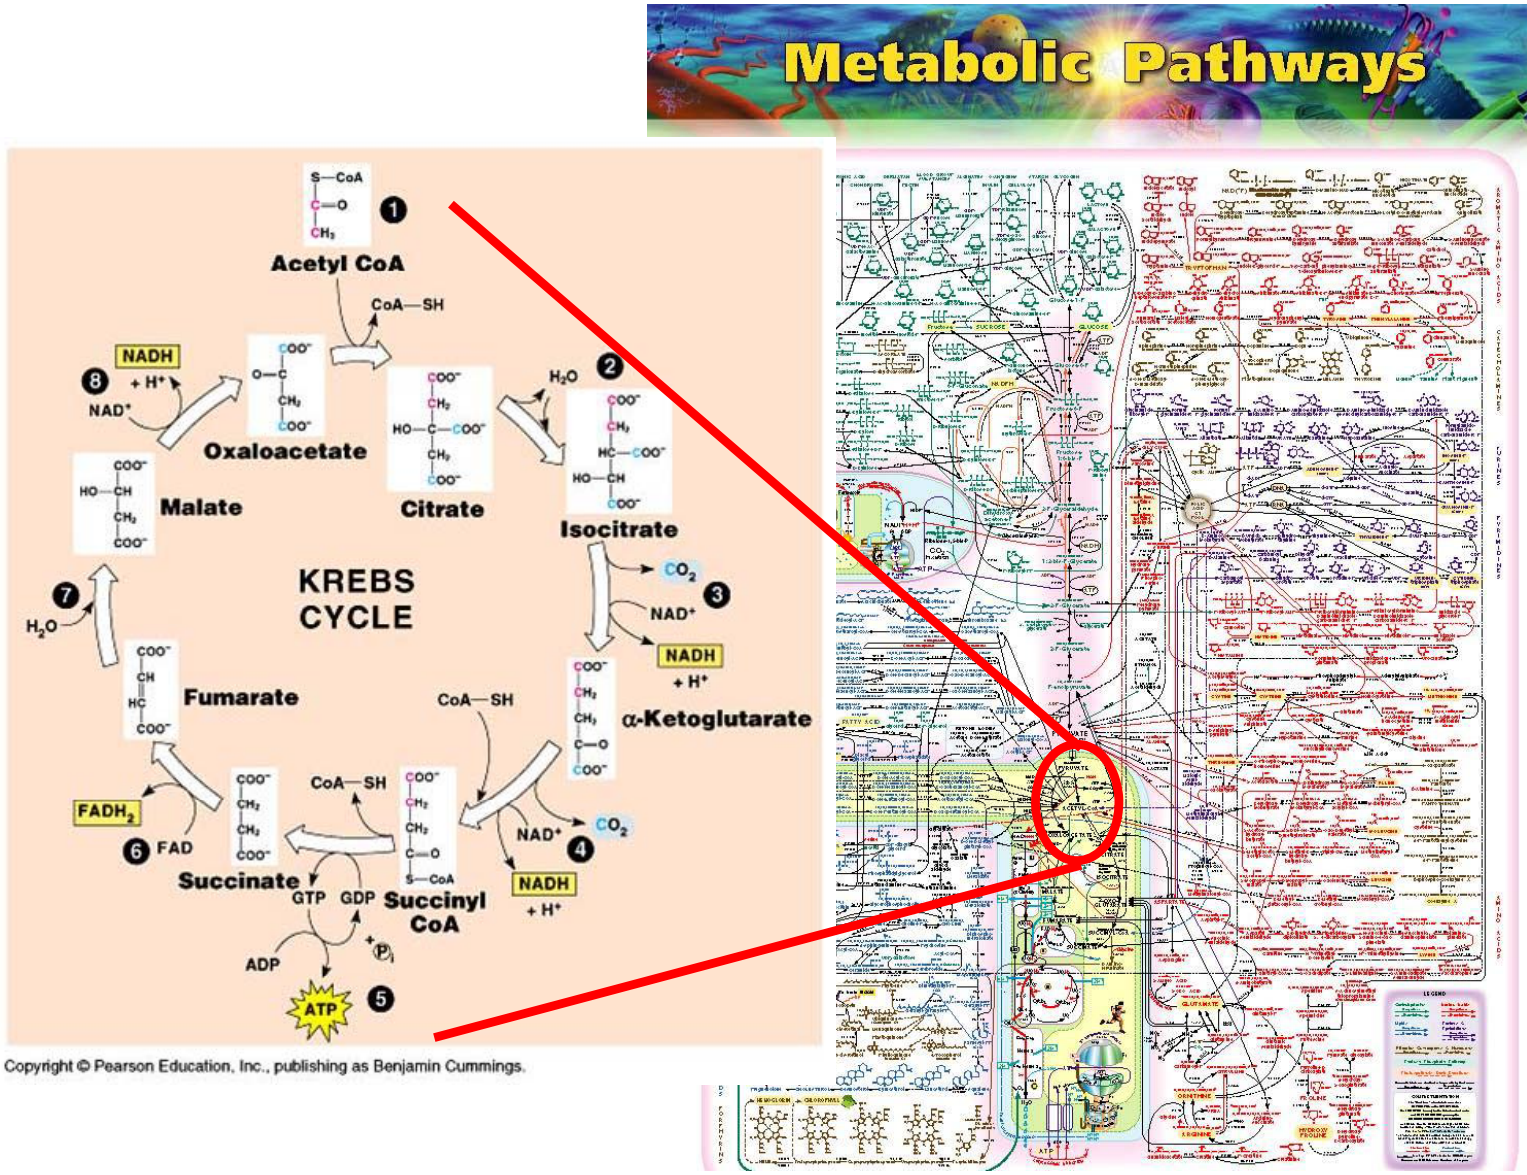








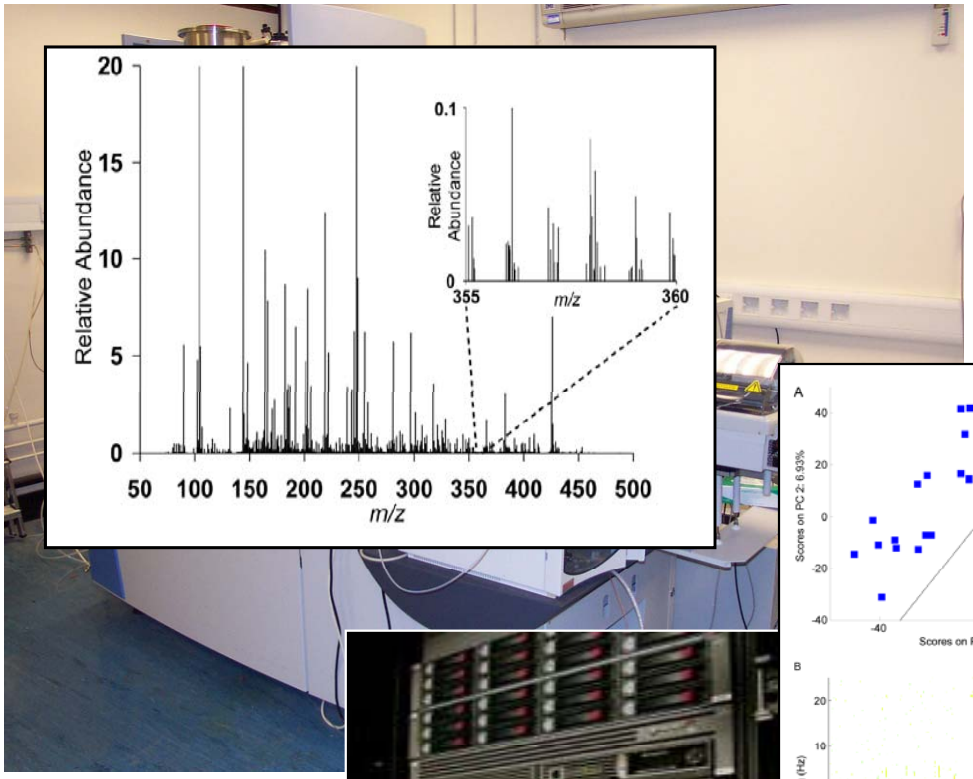
What makes up an organism's metabolome?



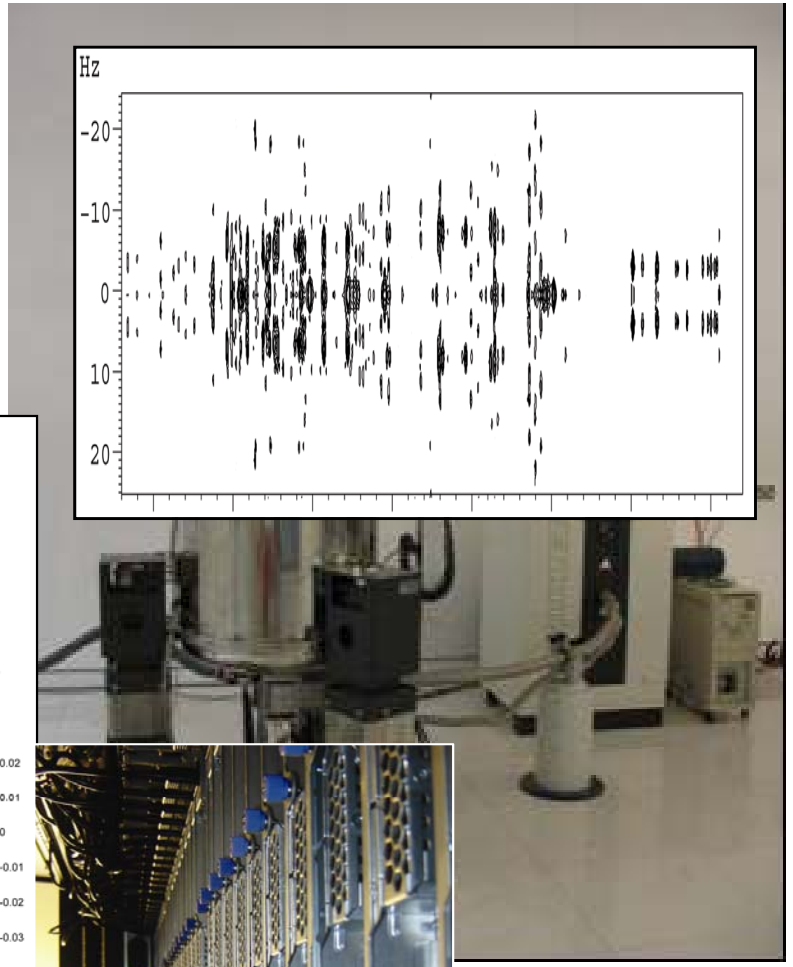
- Amino acids
- Carbohydrates
- Lipids
- Steroids
- Secondary metabolites…
- Estimated to be >10,000 metabolites

Measuring and interrogating the metabolome

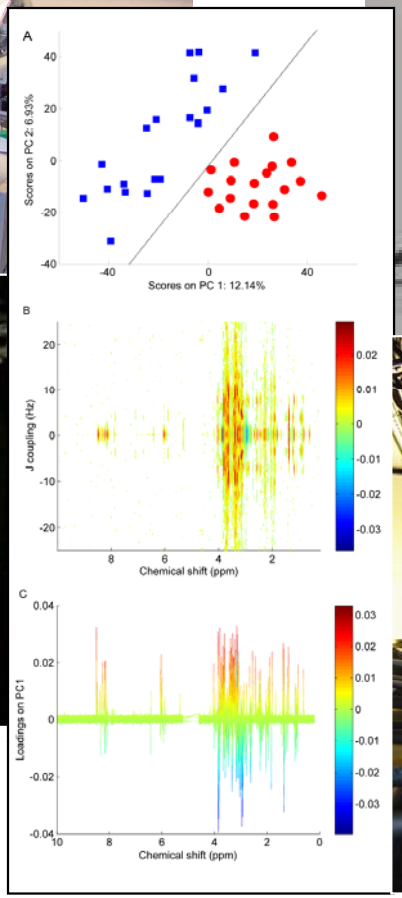
Mass spectrometry



NMR spectroscopy



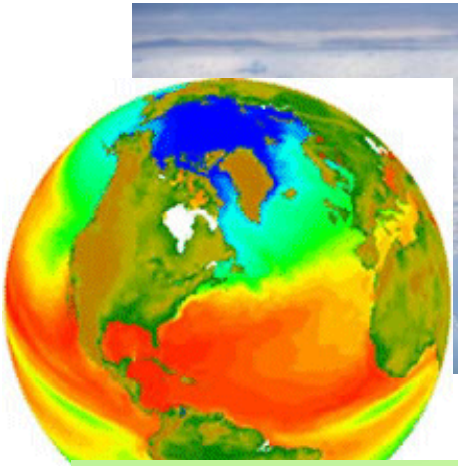
Computational biology

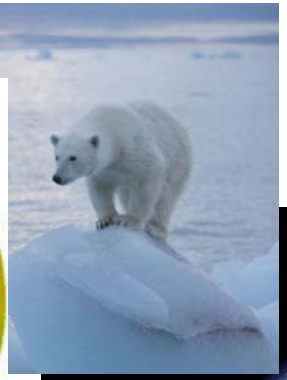


Overview

1. Introduction to environmental metabolomics
2. Workflows
   - Direct infusion mass spectrometry (standardised)
   - Data processing (relatively standardised)
   - Metabolite annotation and identification (not standardised)
3. Examples
   - Endogenous metabolites
   - Xenobiotics within organisms
4. Where next?

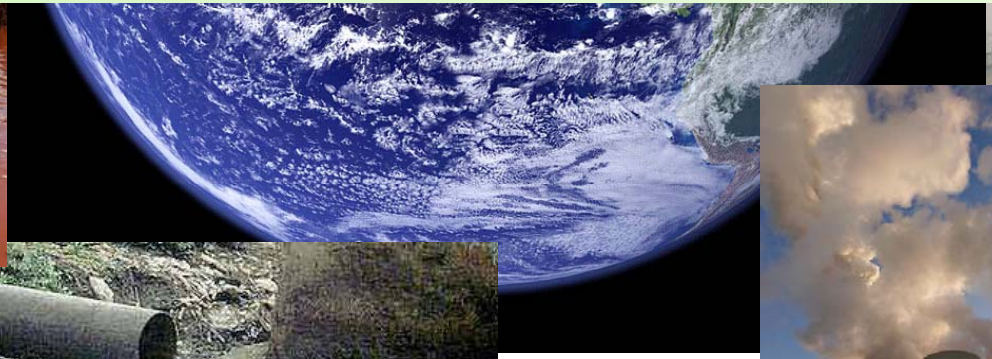
Metabolomics and Environmental stress

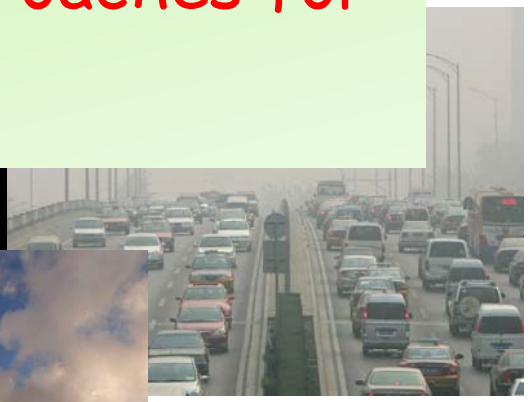




What are the effects of these stressors on living organisms?

Can we develop novel information-rich approaches for environmental regulation?





Water pollution

Air pollution

Environmental monitoring

- Environmental quality assessed (traditionally) by measuring pollutant levels
- European Union has list of ca. 40 priority pollutants

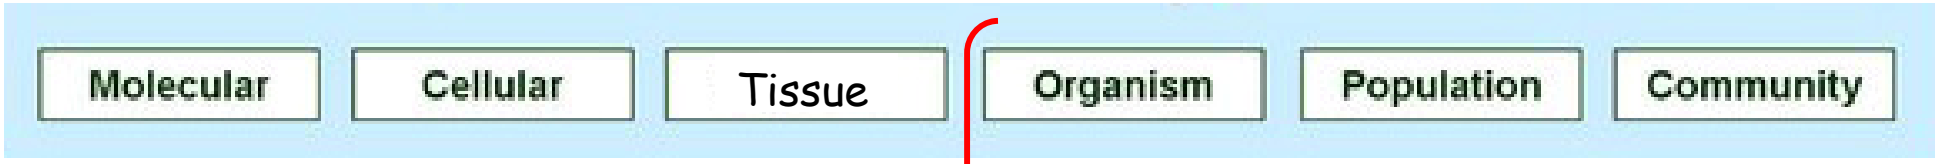
EU WFD (Water Framework Directive, 2005)

- shifted environmental quality assessments towards integrative biological effects monitoring
- currently based on assessment of the composition & abundance of fauna and flora

Need for high throughput, mechanism-based testing strategies to determine environmental health

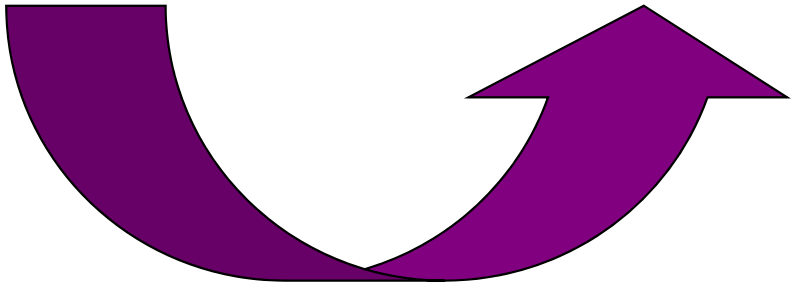
What can molecular biomarkers offer?

Ecological relevance



- Lethality
- Growth
- Reproduction

Basic scientist



Environmental regulator interested in impacts on Darwinian fitness

Molecular markers:

1. Sub-lethal effects
2. Mechanistic understanding
3. Diagnostic fingerprints
4. Early warning indicators

Molecular markers must be strongly linked to higher level responses

Complexity of what we are trying to measure!

Uptake, metabolism & effect of xenobiotics on organism health

Chemical signalling (exometabolome)

Endogenous metabolites (>10,000 forming endometabolome)

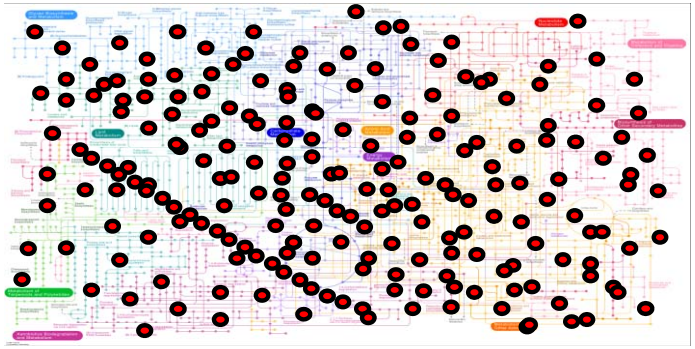
- Biodiversity: 1000's of species, 1000's of metabolomes
- Microbiomes too!

Overview

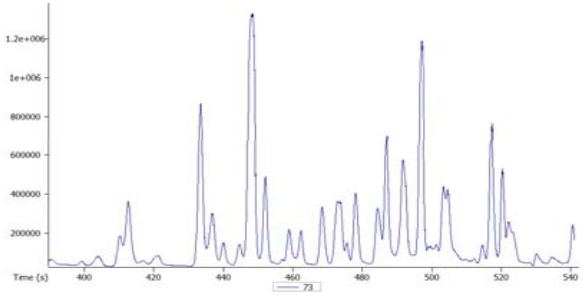
1. Introduction to environmental metabolomics
2. Workflows
   - Direct infusion mass spectrometry (standardised)
   - Data processing (relatively standardised)
   - Metabolite annotation and identification (not standardised)
3. Examples
   - Endogenous metabolites
   - Xenobiotics within organisms
4. Where next?

Non-targeted *vs.* targeted metabolomic studies

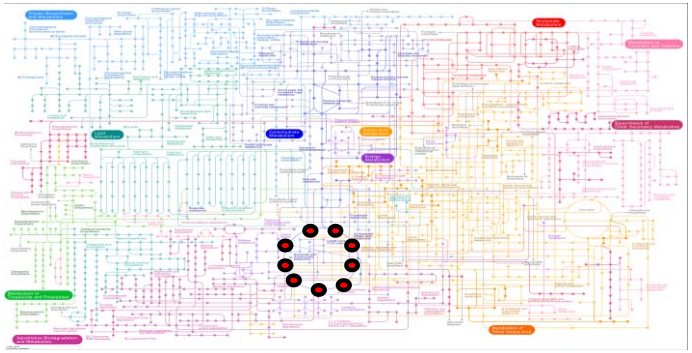
METABOLIC PROFILING or NON-TARGETED ANALYSIS



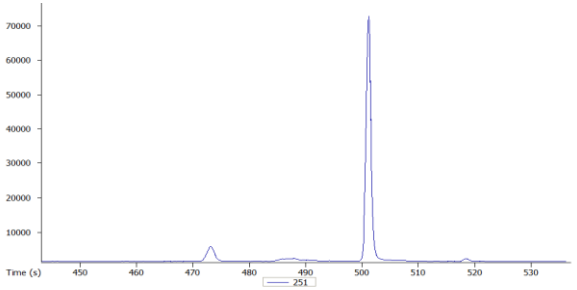
- (Semi)-quantitative detection of a wide range of metabolites
- NMR or GC-MS or LC-MS
- Data acquisition without *a priori* knowledge of biologically interesting metabolites
- Metabolite identification requires post data acquisition
- Discovery/hypothesis generating



TARGETED ANALYSIS



- Quantification of a smaller number of (related) metabolites for
  - generally less than 20
- LC-MS/MS
- Metabolite identity already known
  - no further metabolite identification required
- Hypothesis testing



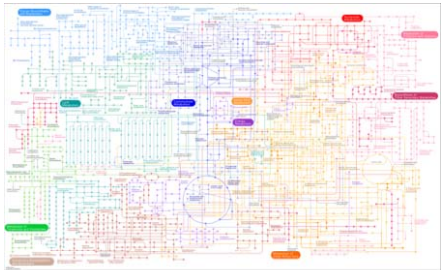
Generic workflow

EXPERIMENTAL DESIGN

BIOLOGICAL EXPERIMENT

ANALYTICAL EXPERIMENT

DATA INTEGRATION, ANALYSIS AND METABOLITE IDENTIFICATION



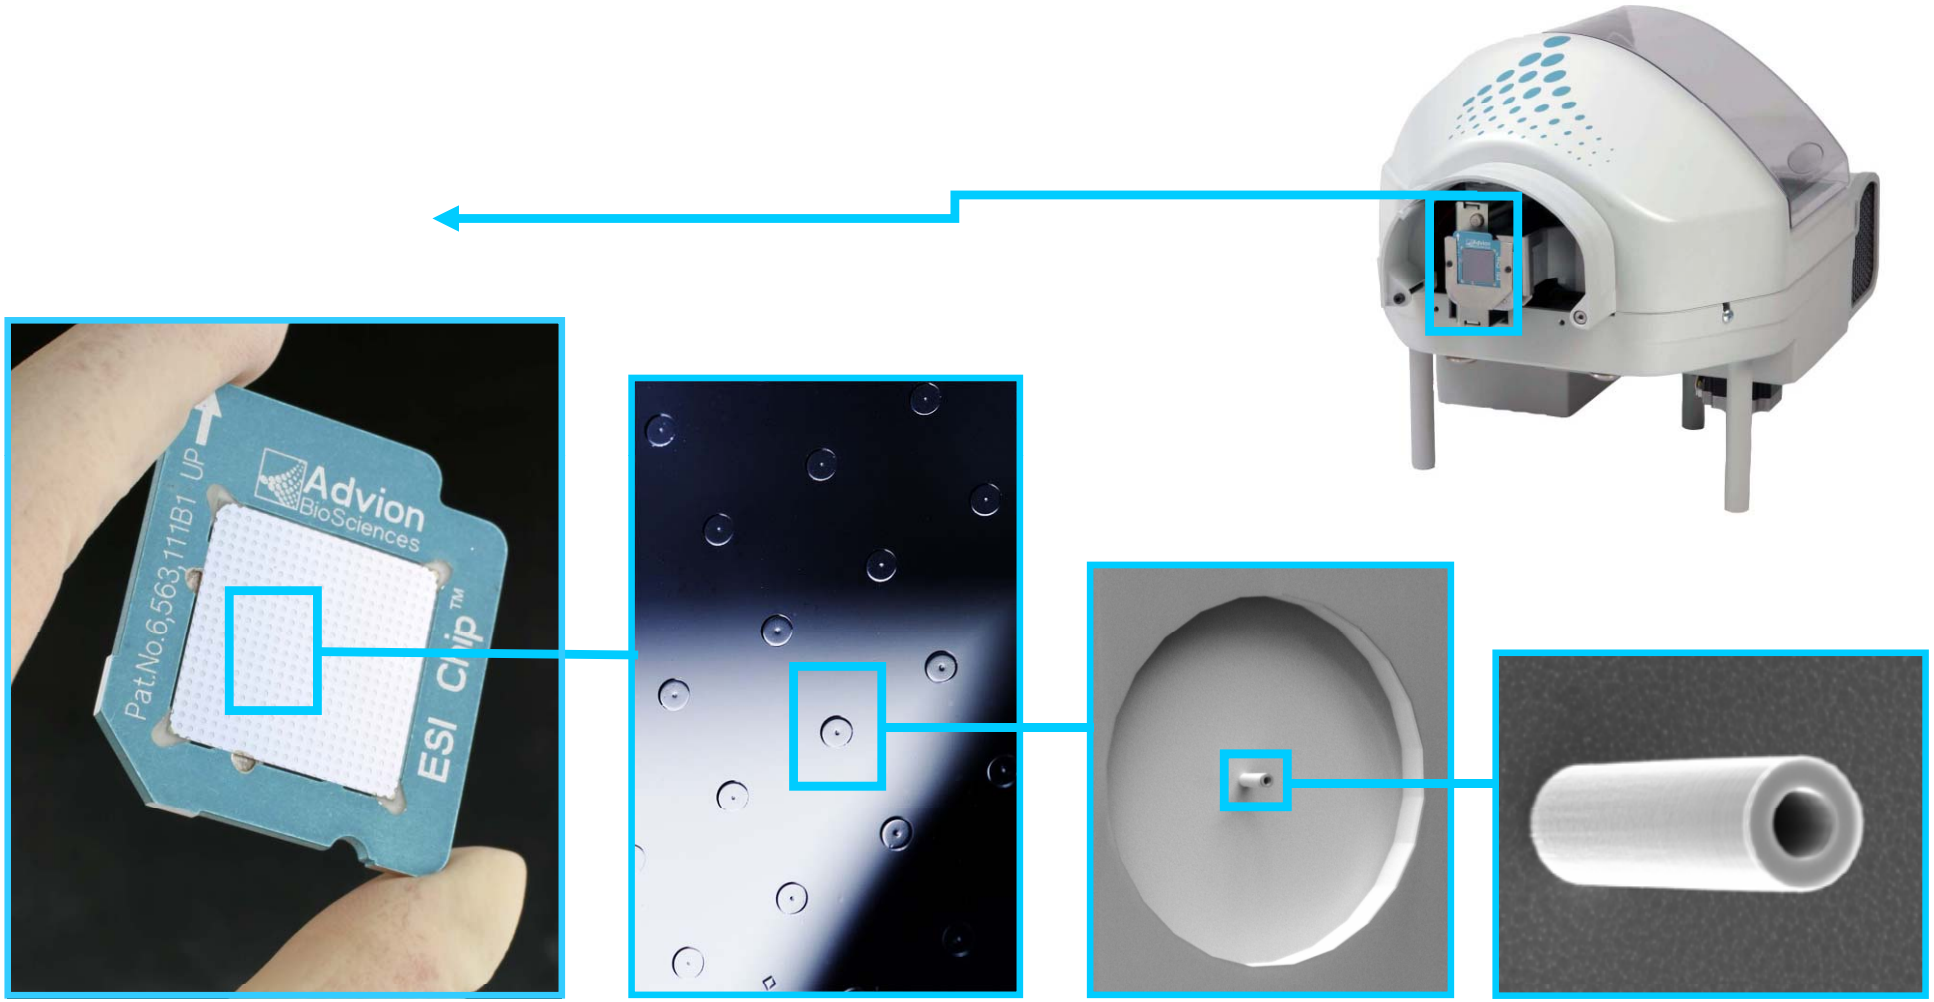
BIOLOGICAL INTERPRETATION

EUREKA!!!!!!!

Why Direct Infusion Mass Spectrometry (DIMS)?

- Non-targeted high-throughput screening approach
- No selection bias due to LC or GC column, yet has high analytical sensitivity
- Potentially low(er) cost than LC-MS
  - Higher sample throughput (few min / sample)
  - Potential savings on consumables
- Extremely high reproducibility of *m/z* data (ppm errors; very small compared to those of LC retention time data)
- But only measures *m/z* (putative annotation of compounds only)
- Potential for ion suppression (but much less of an issue with nano-electrospray ionisation (nESI) than with normal flow rate ESI)

Sample introduction using Triversa chip-based nanoelectrospray system



- Fully automated
- No sample carry-over
- Stable nanoelectrospray (RSDs of few %)

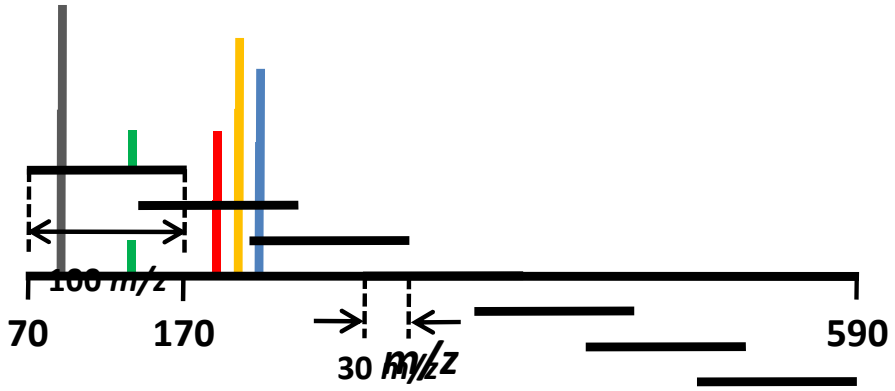
4)

SIM-Stitching



- Collection of multiple adjacent SIM windows that are stitched together
- An optimized strategy for wide-scan DIMS that increases dynamic range but maintains high mass accuracy (ca. 3000 *m/z* measurements, root mean square mass error of 0.16 ppm and max abs mass error of 0.29 ppm)
- Increases metabolome coverage
- Now applied in other research fields, e.g. petroleomics and organic chemistry *

TECHNICAL NOTE Open Access

Galaxy-M: a Galaxy workflow for processing and analyzing direct infusion and liquid chromatography mass spectrometry-based metabolomics data

Robert L. Davidson[1,2†], Ralf J. M. Weber[2†], Haoyu Liu[2], Archana Sharma-Oates[2] and Mark R. Viant[2*]

Abstract

Background: Metabolomics is increasingly recognized as an invaluable tool in the biological, medical and environmental sciences yet lags behind the methodological maturity of other omics fields. To achieve its full potential, including the integration of multiple omics modalities, the accessibility, standardization and reproducibility of computational metabolomics tools must be improved significantly.

Results: Here we present our end-to-end mass spectrometry metabolomics workflow in the wide
Galaxy. Named Galaxy-M, our workflow has been developed for both direct infusion mass spe
and liquid chromatography mass spectrometry (LC-MS) metabolomics. The range of tools pre
processing of raw data, e.g. peak picking and alignment, through data cleansing, e.g. missing
preparation for statistical analysis, e.g. normalization and scaling, and principal components
associated statistical evaluation. We demonstrate the ease of using these Galaxy workflows
DIMS and LC-MS datasets, and provide PCA scores and associated statistics to help other us
they can accurately repeat the processing and analysis of these two datasets. Galaxy and da
pre-installed in a virtual machine (VM) that can be downloaded from the GigaDB repository.
code, executables and installation instructions are available from GitHub.

Conclusions: The Galaxy platform has enabled us to produce an easily accessible and reproducit
metabolomics workflow. More tools could be added by the community to expand its functionality
that Galaxy-M workflow files are included within the supplementary information of publicatio
metabolomics studies to achieve greater reproducibility.

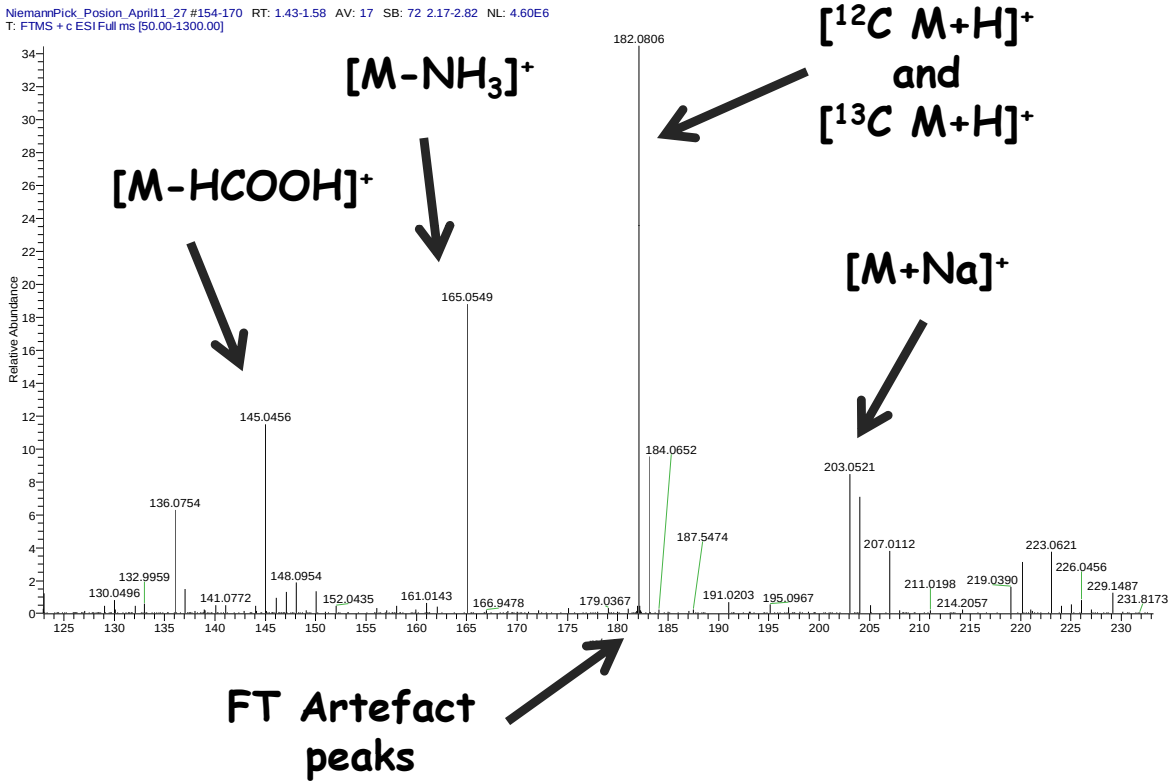
   - Xenobiotics within organisms
4. Where next?

Metabolite identification – A BOTTLENECK IN METABOLOMICS

For metabolomics to be successful it is essential to derive biological knowledge from analytical data - a view emphasised by a Metabolomics ASMS Workshop Survey 2009 which found that the biggest bottlenecks in metabolomics were thought to be identification of metabolites (35%) and assignment of biological interest (22%)

http://fiehnlab.ucdavis.edu/staff/kind/Metabolomics-Survey-2009

Mass spectral data includes another level of complexity



In one sample set there were 20 different "ion types"

<u>Protonated and deprotonated ions</u>
$[M+H]^+$ and $[M-H]^-$

<u>Fragment ions</u>
$[M-HCOOH]^+$ and $[M-NH_3]^+$

<u>Adduct ions</u>
$[M+HCOOK]^+$, $[M+HCOONa]^+$
$[M+3HCOONa]^+$
$[M+NaCl+HCOONa]^+$
$[M+3NaCl]^+$
$[M+Fe]^{2+}$
$[M+Cu]^{2+}$

There is structure to the data - Apply RT, response correlation, *m/z* difference to group metabolite features of same metabolite

Typical workflows for metabolite annotation & identification (DIMS, LC-MS…)

Annotation vs. Identification

- **Identification** = two orthogonal properties (RT, MS/MS) compares to authentic chemical standard under identical analytical conditions

- **Annotation** = one (or more) orthogonal property match to databases (not necessarily acquired under identical analytical conditions)

Salek *et al. GigaScience* 2013, **2**:13
http://www.gigasciencejournal.com/content/2/1/13

COMMENTARY Open Access

The role of reporting standards for metabolite annotation and identification in metabolomic studies

Reza M Salek[1,2], Christoph Steinbeck[1], Mark R Viant[3], Royston Goodacre[4] and Warwick B Dunn[3*]

Abstract

The application of reporting standards in metabolomics allow data from different laboratories to be shared, integrated and interpreted. Although minimum reporting standards related to metabolite identification were

Salek et al., Gigascience 2:13 (2013)

Four levels of confidence

- Sumner et al. Proposed minimum reporting standards for chemical analysis, Metabolomics, 2007, 3:211-221
- Currently, four levels of metabolite identifications can be reported
- Not defining how to perform metabolite identification but defining how to report it

Level	Confidence of Identity	Level of Evidence
1	Confidently identified compounds.	Comparison of two or more orthogonal properties with an authentic chemical standard analysed under identical analytical conditions.
2	Putatively annotated compounds	Based upon physicochemical properties and/or spectral similarity with public/commercial spectral libraries, without reference to authentic chemical standards.
3	Putatively annotated compound classes	Based upon characteristic physicochemical properties of a chemical class of compounds, or by spectral similarity to known compounds of a chemical class.
4	Unknown compounds	Although unidentified and unclassified, these metabolites can still be differentiated and quantified based upon spectral data.

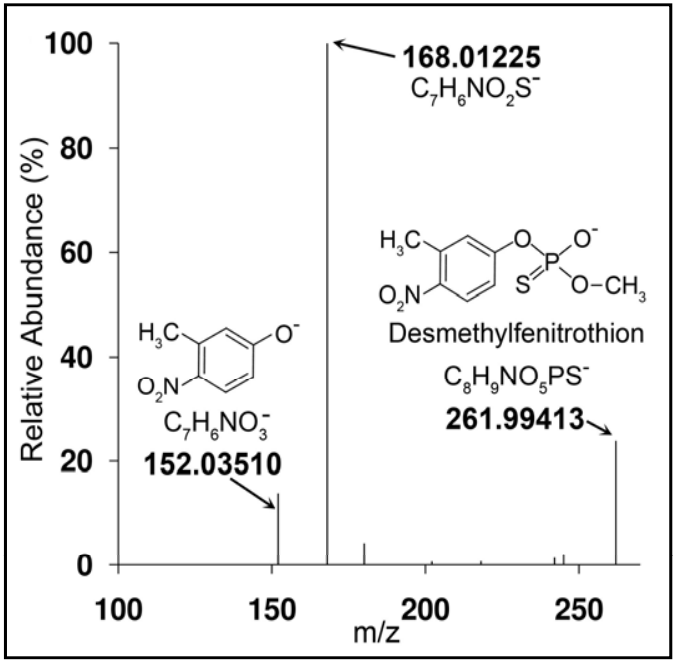
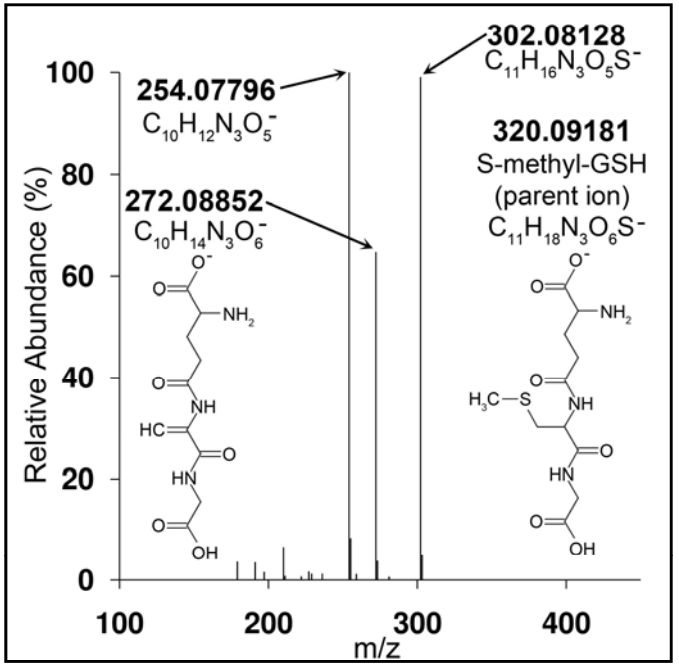
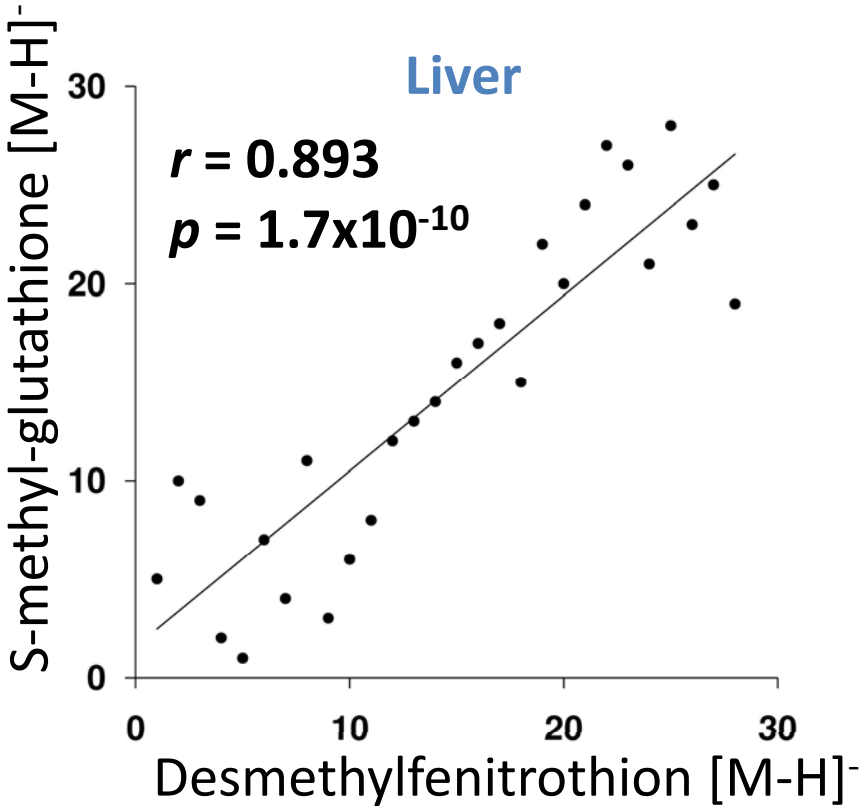
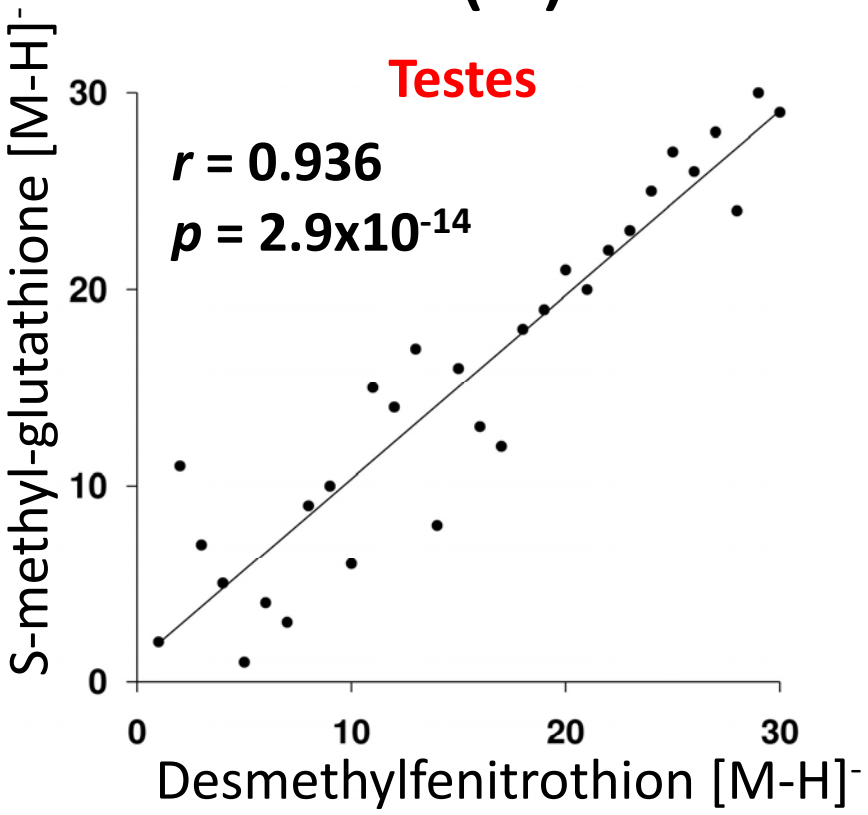
261.99444	**Testes**	2.61×10^{-12}	∞	33.82		
320.09224	**Liver**	2.09×10^{-14}	73.44	15.32	$C_{11}H_{19}N_3O_6S$ **[M-H]$^-$**	**S-methyl-glutathione**
320.09240	**Testes**	3.14×10^{-9}	9.82	9.41		



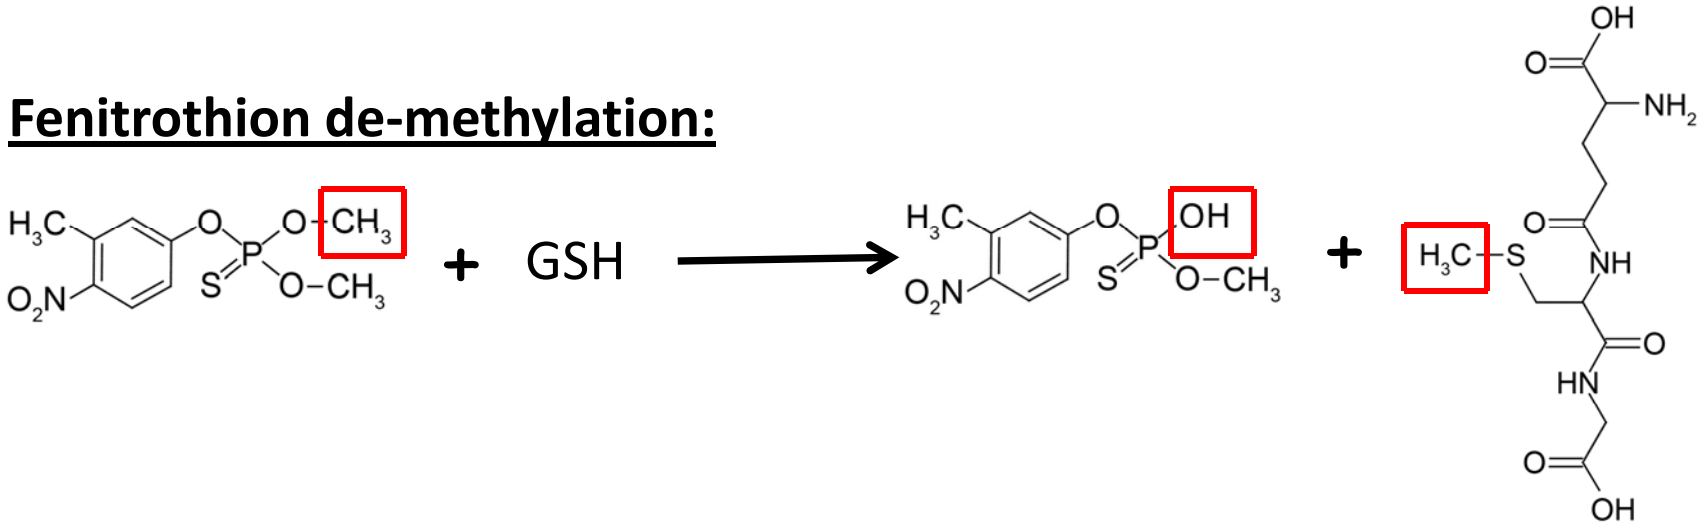


Fenitrothion Metabolism (2)





Fenitrothion de-methylation:



Findings from fenitrothion study

1) Endogenous metabolism: fenitrothion significantly disrupts acetylcholine, disrupts key steroids, affects energy metabolism and disrupts phenylalanine metabolism

2) Xenobiotic metabolism: O-demethylation observed as the major route of fenitrothion detoxification in roach.

Southam et al., Environ Sci Technol 45:3759-3767 (2011)

Complexity of complex, uncharacterised mixture of exogenous (xenobiotic) compounds

Overview

1. Introduction to environmental metabolomics
2. Workflows
   - Direct infusion mass spectrometry (standardised)
   - Data processing (relatively standardised)
   - Metabolite annotation and identification (not standardised)
3. Examples
   - Endogenous metabolites
   - Xenobiotics within organisms
4. Where next?

Reflect on current status…

1. Metabolomics workflows, both analytical and computational, are improving and there is increasing trend towards harmonisation
2. Metabolomics community is generally in favour of open access / data sharing etc.
3. Yet metabolite identification remains a huge challenge
4. How do we accelerate research into metabolite identification?
