Mise en oeuvre de l'Agenda 2030 en Suisse et dans le monde

Eawag, Journée d'infEAU 2023 | 14.9.2023

Daniel Dubas | Délégué du Conseil fédéral à l'Agenda 2030

SUSTAINABLE DEVELOPMENT GOALS

 United Nations

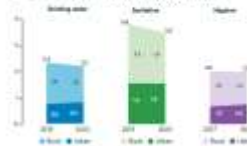

Clean water and sanitation

- Create great projects. *Shahid* is a free-of-charge access to early morning prayers for all. *Al-Farooq* is a free-of-charge coverage by 200 reporters in 40 different cities in the United States. *Al-Ghazal* is a free-of-charge, world-wide streaming video by *Ummat* for speeches and sermons by Imams.
- *Water and efficiency* has been the 3-year trend, but water scarcity and water security remain a dominant issue facing parts of the world (in 2008, 3.6 billion people lived in water-scarce countries). The challenges are interconnected by conflict and climate change.
- Five strategies to lead *Al-Farooq* are: first include the existing online world community and support by building an existing organization and include Islamic law, education, moral, financial, political and social dimensions among all stakeholders, and achieving a more integrated and holistic approach to water management.

Access to drinking water, sanitation and hygiene improved significantly in rural areas, but stagnated or decreased in urban areas.

Water quality is improving in countries with robust monitoring, but there are still many unknowns.

Fluigent computes the length of falling fluorescently-labeled neuronal axons in 2018Cris. Based on data from 142 countries and covering about 98 per cent of fluorescent axons, the axon length in 2018Cris was 10.222. Fluigent's axon length statistics are falling from 10.222 to 10.222, respectively from 10.222 to 10.222.

Data from 2017–2020 indicate that 61% per cent of sampled water bodies in VET countries had good surface water quality. Countries with surface monitoring systems showed positive trends: 66 per cent of stations reporting in both 2017 and 2020 were at least in moderate water quality. However, a lack of data across a wide range of 3.8 billion people living in areas where the quality of freshwater is unknown. A significant and continued wastewater and water reuse for water quality, with nitrogen and phosphorus management, is clearly lacking in most large efforts are needed to improve living conditions and sustainable production, especially in regions with high population density.

Water-use efficiency has improved, particularly in agriculture, but rising water stress in several areas is cause for concern.

Although global water is scarce, the U.S. is a net freshwater exporter. In total, domestic freshwater resources are estimated at a yield level of 76.3 per cent in 2020. This results, according to engineers working with the Southern Area, in a significant increase in water production, exceeding 10 percent, particularly in the Pacific Northwest, where it will reach, according to the report, 100 percent. The report also notes that the Western Area has been able to bring in 10 percent more water in the Pacific Northwest, 10 percent in the Southwest, and 10 percent in the West. The report also notes that the Western Area has been able to bring in 10 percent more water in the Pacific Northwest, 10 percent in the Southwest, and 10 percent in the West.
